This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of the Claims**

1. (previously amended) A method for optimizing a download of requested data to an electronic data processing unit that is currently receiving unrequested multicast data through a router included in a network, the unrequested multicast data corresponding to at least one multicast data group, the method comprising:  
    sending Internet Group Management Protocol (IGMP) V2 Leave Messages for the at least one multicast data group to the router; and  
    ignoring IGMP Membership Queries for the at least one multicast data group issued by the router so as to cause the router to terminate a transmission of the unrequested multicast data to free up available bandwidth for the download of the requested data.
2. (previously amended) The method of claim 1, wherein the requested data comprises at least one of configuration data and program guide data.
3. (previously amended) The method of claim 1, wherein said ignoring step comprises the step of preventing a transmission of an IGMP Membership Report to the router in response to the IGMP Membership Queries.
4. (previously amended) The method of claim 1, further comprising the step of downloading the requested data while the transmission of the unrequested multicast data has been terminated.
5. (previously amended) The method of claim 1, further comprising the step of sensing a receipt of any multicast data so as to identify group numbers of the multicast data.

PU020385**

6. (previously amended) In an network having a router, a system for optimizing a download of requested data occurring concurrently with a receipt of unrequested multicast data from the router, the unrequested multicast data corresponding to at least one multicast data group, the system comprising:

an electronic data processing unit or sending Internet Group Management Protocol (IGMP) V2 Leave Group Messages for the at least one multicast data group to the router, and for ignoring IGMP Membership Queries for the at least one multicast data group issued by the router so as to cause the router to terminate a transmission of the unrequested multicast data to free up available bandwidth for the download of the requested data.

7. (previously amended) The system of claim 6, wherein the requested data comprises at least one of configuration data and program guide data.

8. (previously amended) The system of claim 6, wherein said electronic data processing unit ignores the IGMP Membership Queries by preventing a transmission of an IGMP Membership Report to the router in response to the IGMP Membership Queries.

9. (previously amended) The system of claim 6, wherein said electronic data processing unit further downloads the requested data while the transmission of the unrequested multicast data group has been terminated.

10. (previously amended) The system of claim 6, wherein said electronic data processing unit further senses a receipt of any multicast data so as to identify group numbers of the multicast data.

11. (previously amended) The system of claim 6, further comprising a modem connected in between the electronic data processing unit and the router for exchanging information there between.

12. (previously amended) The system of claim 11, wherein the modem is adapted for use with Asymmetrical Digital Subscriber Line (ADSL).

**CUSTOMER NO.: 24498****Serial No.: 10/524,285****Office Action dated: September 27, 2007****Response dated: November 19, 2007****PATENT****PU020385**

13. (previously amended) A program storage device readable by machine, tangibly embodying a program of instructions executable by the machine to perform method steps for optimizing a download of requested data to an electronic data processing unit that is currently receiving unrequested multicast data through a router included in a network, the unrequested multicast data corresponding to at least one multicast data group, the method steps comprising:

sending Internet Group Management Protocol (IGMP) V2 Leave Messages for the at least one multicast data group to the router; and

ignoring IGMP Membership Queries for the at least one multicast data group issued by the router so as to cause the router to terminate a transmission of the unrequested multicast data to free up available bandwidth for the download of the requested data.

14. (previously amended) The program storage device of claim 13, wherein the requested data comprises at least one of configuration data and program guide data.

15. (previously amended) The program storage device of claim 13, wherein said ignoring step comprises the step of preventing a transmission of an IGMP Membership Report to the router in response to the IGMP Membership Queries.

16. (previously amended) The program storage device of claim 13, further comprising the step of downloading the requested data while the transmission of the unrequested multicast data has been terminated.

17. (previously amended) The program storage device of claim 13, further comprising the step of sensing a receipt of any multicast data so as to identify group numbers of the multicast data.
